

PRODUCT README

Prompt Grabber

Bring previous prompts back into your workflow.

Prompt Grabber automatically captures prompts as you work, helps you find them later, and lets you combine or compile selected prompts into a cleaner starting point.

Automatic capture

Exact Combine

Local AI Compile

Rule Book

Notes

Prompt Pool

Capture

Save prompts as you send them.

Build

Select, Combine or Compile.

Reuse

Review, copy and use again.

Your prompt memory

Capture quietly in the background, then find the right prompt when you need it.

1 Capture automatically

Prompts are saved when submitted. Enter capture can be enabled, Shift + Enter is ignored, and source URLs can be stored without query data.

2 Find fast

Search by prompt text, filter by AI site or date, sort newest or oldest, and open Full History when you need the complete library.

3 Grab now

Grab now scans the open conversation for user-authored prompts that are currently loaded on the page, then saves only the missing ones.

Build from previous prompts

Choose the parts you want. Keep the source text intact.

1 Select prompts

Use the Grab icon on any saved prompt. Selection order is preserved, so you

2 Combine

Combine is lossless. It joins selected prompts with simple separation and does not rewrite, summarize, or reinterpret the text.

Why this matters Old prompts become reusable building blocks instead of disappearing inside past chats.

Add rules only when needed

Use a lightweight rule system to guide Compile without changing Combine.

1 Toggle control

Only rules switched ON are sent to Compile.
Rules switched OFF are ignored completely.

2 Partial rules are valid

A rule can contain just what matters: Role, Context, MUST / MUST NOT / SHOULD, Output Format, and optional examples.

3 Rules are optional

Compile still works when there are zero active rules. The Rule Book is guidance, not a gate.

Compile into one cleaner prompt

Use browser-provided local AI to reshape selected prompts into a cohesive starting point.

1 Preserves the important details

The compiler is instructed to keep facts, names, numbers, requirements, examples, constraints and user intent.

2 Review before you copy

The result opens in an editable preview. Nothing is permanently saved as a separate output unless you copy it elsewhere.

Local-first compile Uses the browser on-device LanguageModel when supported. No paid AI API key is required.

Notes stay useful, not intrusive

A small autosaving space for context, reminders and rough ideas.

1 Autosaves while you type

Notes use local browser storage and save continuously. There is no ordinary Save button.

2 Separate from prompts

Notes are not silently included in Combine or Compile. They remain a supporting workspace until you choose to reuse the text yourself.

3 Available in both views

Create and edit notes from the popup or Full History. The same local note collection stays synchronized between both views.

Optional cloud Prompt Pool

Discover reusable prompts, share selected work, and pull useful prompts back into your local workflow.

Google sign-in

Cloud features use Google authentication through Supabase. Local capture, Combine, Compile and Notes do not require sign-in.

Niches & discovery

Start with niches such as Excel and Word. New categories can be added as the pool grows.

Vote & grab

Upvote or downvote useful prompts, then Grab a cloud prompt back into local history and selection.

Cloud architecture

Supabase Postgres stores metadata and voting. Prompt bodies are stored as Markdown objects in Supabase Storage. Object path: {niche_slug}/{user_uuid}/{prompt_uuid}.md

A simple workflow to remember

Use Prompt Grabber as memory first, composition second, cloud only when it helps.

LOCAL WORKSPACE

- Automatic capture
- Prompt history + editing
- Date & site filters
- Combine (unchanged text)
- Compile with optional rules
- Autosaved Notes

OPTIONAL CLOUD POOL

- Google authentication
- Shared prompt niches
- Upvote / downvote
- Markdown prompt storage
- Grab back into local history
- No automatic local-history sync

Install and use

1. Extract the extension package and open `chrome://extensions` or `edge://extensions`.
2. Enable Developer mode, choose Load unpacked, and select the extension folder.
3. Reload existing AI tabs once. Prompt capture then works automatically on supported sites.
4. Click the Prompt Grabber logo to open the Prompt Pool when cloud reuse is useful.

Local-first by default: captured prompts, Rule Book entries, selection state and Notes remain in `chrome.storage.local`.
